

First, we have to convert the raw data into Table >it makes us easy to operate

Preparing a table of Sales and Profit month-wise in a working sheet

Under month Write Jan and then drag down Cursor below till Dec, then to next column write sales and in next column write profit

Month-Wise Total sales and Total profit based on product category

Copy a list of categories from sales data table and paste it under list of categories in Working sheet and then make it unique by using removing duplicates under data tab and then create a product category drop down list

Dropdown list- An Excel drop down list is a data validation function that allows users to select an option from a list of choices. if we want to select another category from specified list we will get result of that category

Drop down list of product category

Data->Data Validation -> Select List under allow->source range-D2:D5 then click on okay .

Use Sumifs To get a Monthly total sales and total profit based on Product Category

Sales=>=SUMIFS(Salesdata[Sales],Salesdata[Months],A3,Salesdata[Product Category],\$H\$2)

Profit->=SUMIFS(Salesdata[Profit],Salesdata[Months],A3,Salesdata[Product Category],\$H\$2)

Preparing the Sales table region-wise in the working sheet

Write region in one cell under that cell, copy region list from salesdata table and paste it

Under Region and make it unique by using removing duplicates

Sales based on region wise->

=SUMIFS(Salesdata[Sales],Salesdata[Region],J2,Salesdata[Product Category],\$H\$2)

Sort the data in alphabetical order

Create a column chart of the month-wise table and region-wise table

Select the table of sales and profit then tap on insert -> Recommended charts ->column charts-> clustered column chart

Blue line represent Total sales and orange line represents total profit Where the sales is high, profit is also high and vice versa and then customize/format column chart by changing its background color, text outline -solid line with black color, etc

Same we will select region table tap on insert then create clustered column chart and customize /Format it.

Creating a dashboard using all the visualizations created for the project

Go to insert tab->Shapes-select rectangle

Drag it in working sheet and change the background color to green

Then drag the Sales and profit and sales by region clustered chart to dashboard and adjust it according to shape

Then place total sales ,total profit and Quantity how much we sold to dashboard by creating shapes

We will add small rectangle shapes under profit, sales and quantity for their totals and format shapes

Then we will do sumifs for total sales, total profit and quantity based on product category in separate single cell and then rename cells as Totalsales, Totalprofit and Qty respectively.

Then We will click on blank column below total sales of dashboard and then on formula bar write =Totalsales then total amount will appear on blank column below total sales, same with total profit and Quantity.

Select all in dashboard then right click and then select group under it hit on group then it will link into one

Thus, We created an interactive dashboard in Excel that provides a comprehensive view of the sales data, allowing stakeholders to make informed decisions
